

Not all Rodent Baits are the same

What is the difference between Green and Red?

There are 2 different Tomcat rodent baits, **Tomcat (green)** and **Tomcat II (red)**

Why 2 baits and what is the difference anyway?

Tomcat (green) dyed bait) has the active **bromadiolone**. It will provide a single feed kill for all rats and mice.

Tomcat II (red) dyed bait) has the active **brodifacoum**.) This is also a single feed rodenticide. It is **4 times stronger** than **Tomcat (green)** so less is needed to be consumed for a result.

If potential poisoning of pets is a concern to the customer, then because of its lower toxicity, the green Tomcat would be the product of choice. Tomcat II is more appropriate when rodent numbers are high and for a fast kill .

Both formulations of Tomcat blox offer the following advantages over other baits:

- Unique, groovy shape to provide gnawing edges and increase bait acceptance
- Low wax content for improved palatability
- **16 food grade additives** for improved palatability
- Extruded blox ensures even toxicity across the bait and high weatherability.
