

Ferticote

The FertiCote granular fertiliser blends are specifically formulated to release nutrients at a controlled rate to better match a particular crop's growing requirements. Water vapour penetrates the FertiCote granules, allowing the nutrient content to be diffused into the soil at a controlled rate.

The rate of release is determined by the blend longevity specification, with options of 4, 6, 8 and 12 months available. The release of nutrients is dependent on soil temperature and not soil moisture availability, so waterlogging events do not affect the release pattern.

FertiCote blends are used at planting and early side-dressing to cover the base source of nutrition for crops.

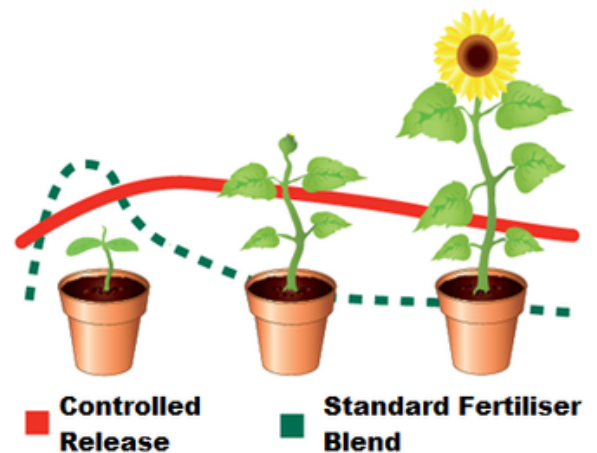

Benefits

- Controlled nutrient release options of 4, 6, 8 and 12 months
- Less nutrient losses and more plant utilisation
- Fuel, time and labour savings
- Uniform growth response

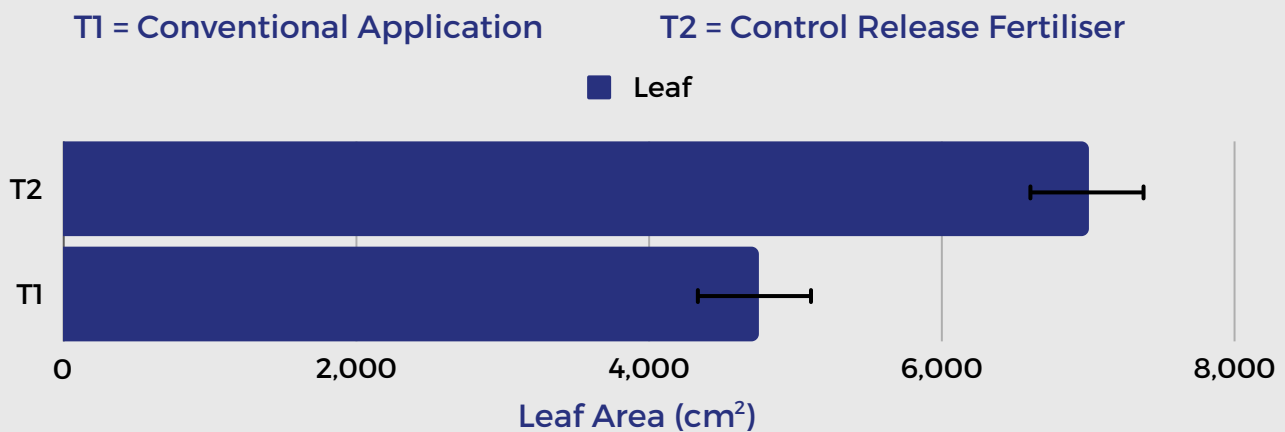

Analysis w/w:

N %	P %	K %	S %	Ca %	Mg %
7	2	14	3.2	2.5	1.6

- 65% controlled release nitrogen—8 months
- 100% controlled release potassium—8 months
- 20% soil conditioners
- Urea free
- Muriate free

Analysis of plants at six months showing a significant difference between treatments

Significant difference found between treatments for leaf, stem and overall total plant mass.
