GRANULAR DOLOMITE STANDARD

Soil Amendment

Analysis: 17% Calcium, 11.5% Magnesium,
Neutralising Value - 95

GRANULAR DOLOMITE STANDARD

A quality granulated dolomite soil amendment, derived from fine powdered dolomite. The granular dolomite formulation enables easy application to soil.

Powdered dolomite is difficult to apply accurately for many users and can be a messy experience in general. In windy conditions powdered dolomite easily drifts off target and makes for inaccurate non-uniform application to soil.

Granular Dolomite Standard from Amgrow enables easy application of dolomite to soil to accurately and uniformly amend soil. Dolomite is generally used to lift soil pH if soil is too acidic. A soil pH of 5.5 and lower will generally be an indication that lime or dolomite is required to raise the soil pH and allow plants to continue to grow optimally.

GRANULAR DOLOMITE STANDARD BENEFITS

- No messy powder to handle and apply
- Can be applied through traditional granular fertiliser spreaders
- Finer than standard dolomite
- Granules break down rapidly with soil moisture
- Increases soil pH and increases soil calcium and magnesium levels

PACK SIZE

Available in 20 kg bags.

PRODUCT CHARACTERISTICS

Colour	Size	Bulk Density
Off White/ Beige	2-6mm granule	1.2

GRANULAR DOLOMITE STANDARD - *Soil Amendment*

APPLICATION

Granular Dolomite Standard can be broadcast with traditional granular fertiliser application equipment. Soil tests at least once per year are recommended to determine your dolomite application rate. Rates will vary for each situation, so see your local agronomist.

DIRECTIONS FOR USE:

Soil Type	Broadcast Rate (kg/ha)
Light Sandy Soil	500
Loamy Soil	750
Heavy Clay Soil	1000 +
